How to use these notes

These notes cover everything you need to know for this part of the specification. They have been written in question-answer format to make them easier for you to study from.

In order to study successfully, I recommend you do the following for each question and answer:

- Read it carefully and make sure you **understand** it.
- **Memorise** the answer.
- **Practice** applying your understanding to past exam questions.

A good way to memorise information is to use **retrieval practice**. This is when you practise retrieving information from your memory. You could do this by making a flashcard for each question with the question on one side and the answer on the other. Or you could use a flashcard app. Alternatively, use a sheet of paper to cover up the answer so you can only see the question. Try to answer the question and then check how you did.

You should practise retrieving each answer from your memory until you can do it perfectly. Even once you can retrieve the answer perfectly, your ability to retrieve it will probably fade as time passes without practising. Therefore you will need to keep going back to the questions that you have previously mastered and practising them again. However, each time you re-learn the answer, the memory will be stronger and will last longer than the time before.

What is biomass?

Biomass is the mass of living organisms.

What is a pyramid of biomass?

A pyramid of biomass is a diagram that shows the total biomass of each species in a food chain in a particular habitat. It consists of a series of rectangles stacked on top of each other. Each rectangle represents one species. The bottom rectangle represents the producer, the next one up represents the primary consumer and so on. The width of each rectangle represents the total biomass of that species in the habitat. All the rectangles are the same height.
